Own Ebook Script - Start here

Your independently hosted ebook platform.

1. Open your Gumroad purchase

Download the full installation ZIP and copy your personal Gumroad license key.
Use that key as the activation code in the installer; no separate portal signup is needed.
Public documentation: https://account.ownebook.com/docs

2. Choose compatible hosting

Use provider-prepared shared hosting with Node.js, Chromium and MongoDB Atlas.
Prepared Hero stays at 512 MB. Allow 8 GB free disk. Heavy work may exceed the quota.
A new managed Ubuntu server is also supported. Hosting and service fees are separate.

3. Install and activate

Keep the ZIP outside public_html. Configure start.cjs, enable HTTPS and open your domain.
Unlock the browser installer; enter Atlas details, your administrator and Gumroad key.
https://account.ownebook.com/docs/shared-hosting-ar
Managed servers: https://account.ownebook.com/docs/install

4. Updates and backups

Admin -> Software license shows activation and available signed releases.
Use the update command shown for your installation type in the guide.
The updater verifies the package and backs up the database and persistent files.
Your purchase includes one production site, one development site and 365 days of updates.

Your installation is independent

Your users, books, database and provider accounts belong to your own installation.
The hosted ownebook.com service and the public demo are separate products.

Need help?

Contact the seller through your Gumroad purchase with your order number.
Never share your activation code, database URI or private keys publicly.
